

Executive Summary & Operational Context

Daikibo Industrials collected telemetry data across 4 global factory locations over May 2021 (messages sent every 10 mins). An "unhealthy" telemetry status represents **10 minutes of operational downtime**. This analysis pinpoints primary bottlenecks to optimize plant performance.

Key Insights & Telemetry Findings

- Highest Facility Downtime:** Daikibo Factory Seiko registered the worst downtime (480 minutes), closely followed by Daikibo Shenzhen (420 minutes).
- Lowest Downtime:** Daikibo Berlin operated near perfectly with only 20 minutes total downtime.
- Critical Machine Bottlenecks:** Laser Welder (480 mins) and Laser Cutter (430 mins) account for over 88% of total downtime globally.
- Site-Specific Impact:** Cross-filtering reveals Seiko's downtime is driven exclusively by Laser Welders, while Shenzhen's is driven by Laser Cutters.

Factory Downtime Summary Table

Factory Location	Primary Failure Machine	Total Downtime (Mins)	Impact Level
Daikibo Factory Seiko (Osaka, Japan)	Laser Welder	480 mins	Critical
Daikibo Shenzhen (Shenzhen, China)	Laser Cutter	420 mins	High
Daikibo Factory Meiyo (Tokyo, Japan)	Laser Welder & Laser Cutter	110 mins	Moderate
Daikibo Berlin (Berlin, Germany)	Furnace / Minor Equipment	20 mins	Optimal

Strategic Recommendations

- Immediate Maintenance Intervention:** Dispatch specialized technicians immediately to audit and service Laser Welders at Seiko and Laser Cutters at Shenzhen.
- Automated Telemetry Threshold Alerts:** Configure Tableau/IoT server triggers to issue real-time maintenance tickets whenever a machine logs consecutive "unhealthy" statuses exceeding 20 minutes.
- Cross-Plant Knowledge Transfer:** Benchmark Daikibo Berlin's preventative maintenance schedule to standard operating procedures across all Asian facilities.

Investigation Background & Methodology

Following internal complaints regarding gender pay disparity, the Forensic Tech team deployed an algorithm quantifying gender pay equality across 37 job roles in 4 global facilities. Scores range from **-100 to +100** (0 is ideal). Roles were classified into: **Fair (-10 to +10)**, **Unfair (-20 to -11 / +11 to +20)**, and **Highly Discriminative (<-20 / >+20)**.

Pay Equality Distribution Across Factories

Factory Location	Fair	Unfair	Highly Discrim.	Severe Disparity Roles Identified
Daikibo Factory Meiyo (Tokyo)	4	4	3	C-Level (-25), VP (-26), Operational Support (-22)
Daikibo Factory Seiko (Osaka)	5	2	3	Sr. Manager (-21), Manager (-21), Jr. Manager (-24)
Daikibo Shenzhen (China)	5	2	1	Sr. Manager (-21)
Daikibo Berlin (Germany)	5	3	0	None (Highest Overall Equity)
Total (Global)	19 (51.4%)	11 (29.7%)	7 (18.9%)	7 Total Severe Disparity Roles

Key Forensic Findings

- Leadership Level Disparity:** Gender wage gaps are heavily concentrated in senior management (C-Level, VP, Directors, Managers), with scores routinely falling below **-15 to -26**.
- Factory Variance:** **Daikibo Meiyo** and **Daikibo Seiko** exhibit highest severity (3 Highly Discriminative roles each), whereas **Daikibo Berlin** has zero.
- Operational Staff Fairness** Engineering & shop-floor roles (Engineers, Operators) consistently fall within the **Fair (-10 to +10)** band across all plants.

Forensic Audit Recommendations

- Executive Compensation Audit:** Conduct immediate targeted wage adjustments for VP/C-Level in Tokyo and Managers in Osaka to bring scores within the Fair boundary.
- Global Salary Banding Policy:** Standardize role-based salary bands and objective benchmarks to prevent bias during hiring/promotions.
- Annual Equal Pay Auditing:** Institutionalize automated annual pay equity audits using this forensic algorithm for ongoing compliance.
